

PRODUCT OVERVIEW

Our product is a wristband that can detect vitals such as blood pressure, heart rate, temperature with the TrueNeed™ system. It also contains a gyroscope that can detect if you have fallen suddenly and contains GPS that detects where you are at all times. Another feature it contains is Bluetooth connectivity, to help you speak through a smartphone nearby and through your wristband during any emergency. Also there is a button on the wristband that if you press twice you can receive help from the call center as well as automatically being notified. There is an app that close family or friends can have on their phone that notifies them if anything unusual is happening to their loved one.

The process of how our product works is that the wristband that you are wearing, detects vitals as mentioned and is monitored. If any vitals such as your blood pressure or heart rate, appear at dangerous levels, the app that your close family members or friends have on their phone will receive a notification on what is going on with your body read by the wristband itself. While that is happening a call center is involved and contacted and they will ask if your okay and they call the phone number left when you registered for VitalSupport will be contacted and if they get no response for anyone or from the two way Bluetooth speaker, then 911 will be contacted and sent to your location from the GPS system.

Product Features

- CPU Sensor, the TrueNeed™ system that measure vitals and health measurements
- GPS; Location sent to first responders so you will get the help you need in time
- Gyroscope Sensor; Detects falls or sudden impact to help alert the call center in an emergency
- Accelerometer Sensor
- Manual Button
- Short Charge Time
- Bluetooth Connectivity
- Two-Way Speaker
- Watch Functionality
